SATURN V PREVALVE

This valve is a very small part of a Saturn V rocket, the rocket type that launched the Apollo moon missions. It's one of five liquid oxygen (LOX) valves on the rocket.

LOX flowed through this valve at 110,000 bars (29,000 gallons) a minute—enough to fill a typical backyard swimming pool in a minute! For this 193-kilogram valve (425 pounds) could shut off that flow in a third of a second.

Saturn V Launches on the Apollo 11 Mission

Ráno vstaneme...

Fecal Collection Assembly

Apollo

These two bags make up the fecal collection assembly, part of the personal hygiene system used by Apollo astronauts. These bags were not flown. This self-contained system kept the astronaut fecal matter and urine in a separate container and allowed for simple and hygienic disposal.

Provided from NASA Johnson Space Center

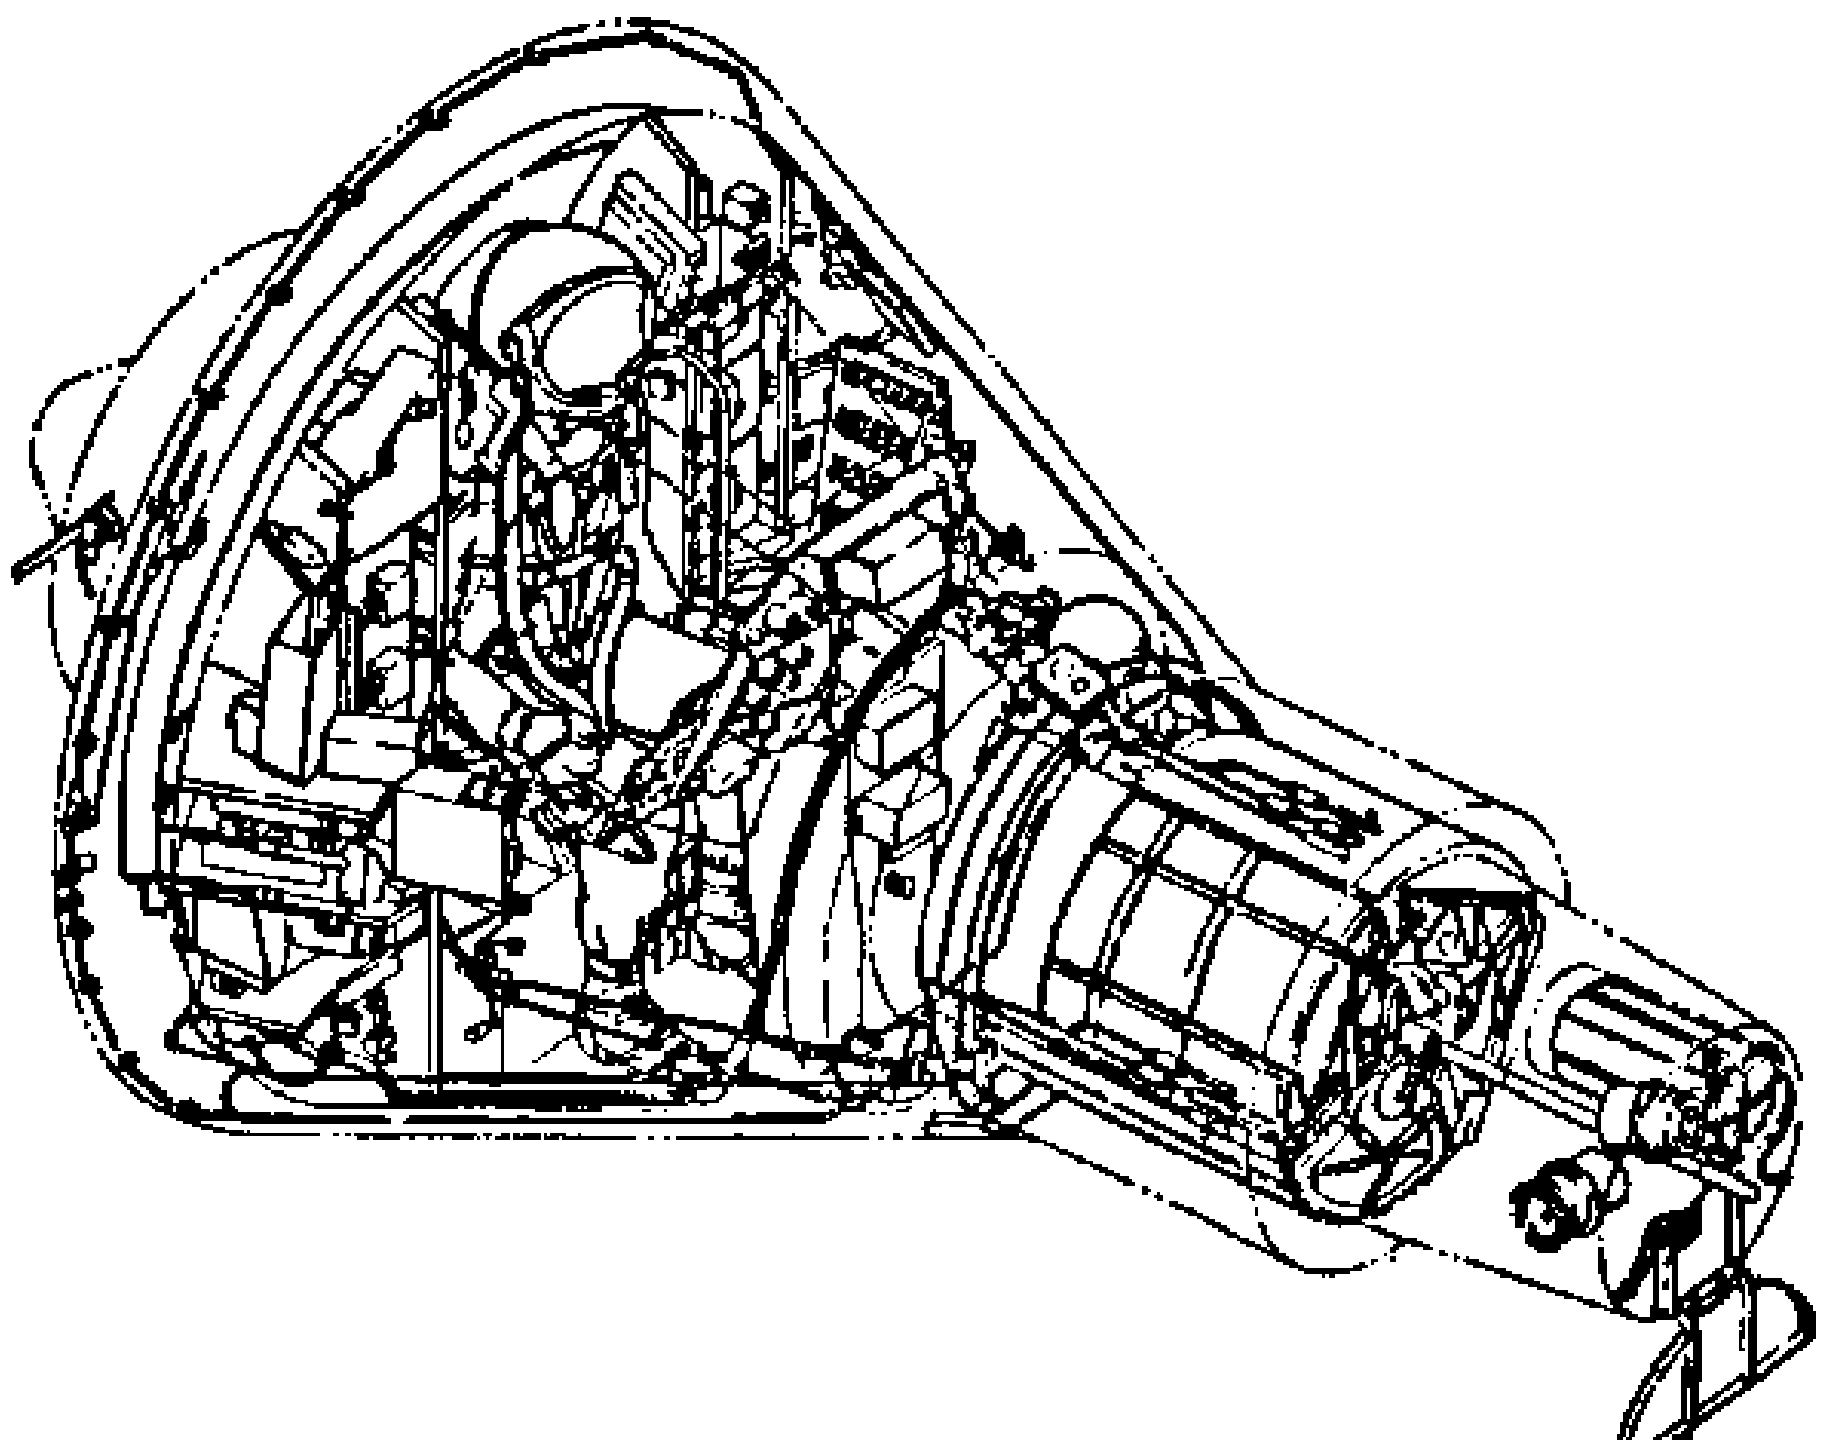

Disposable Absorption Containment Trunk

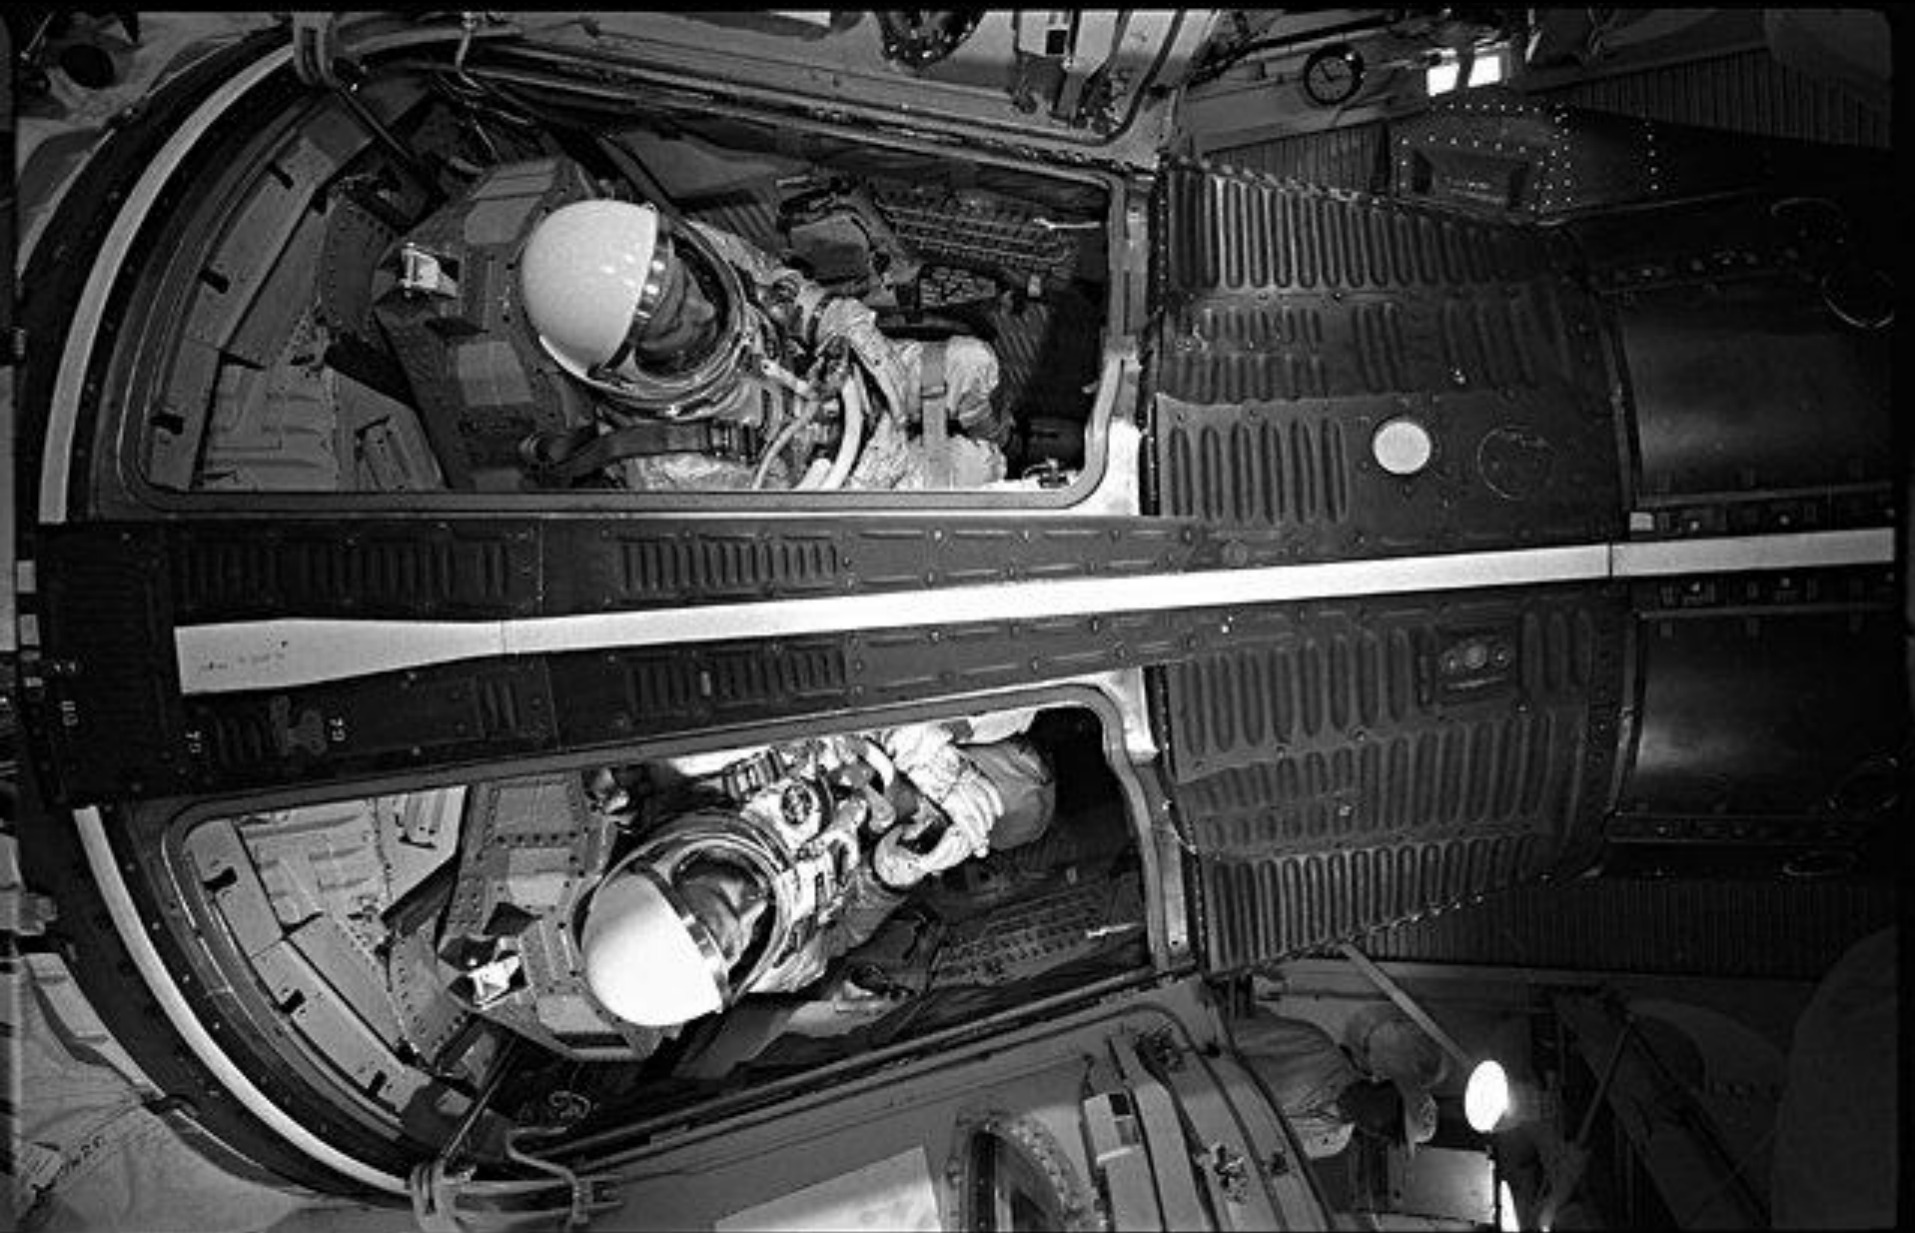

Apollo 11

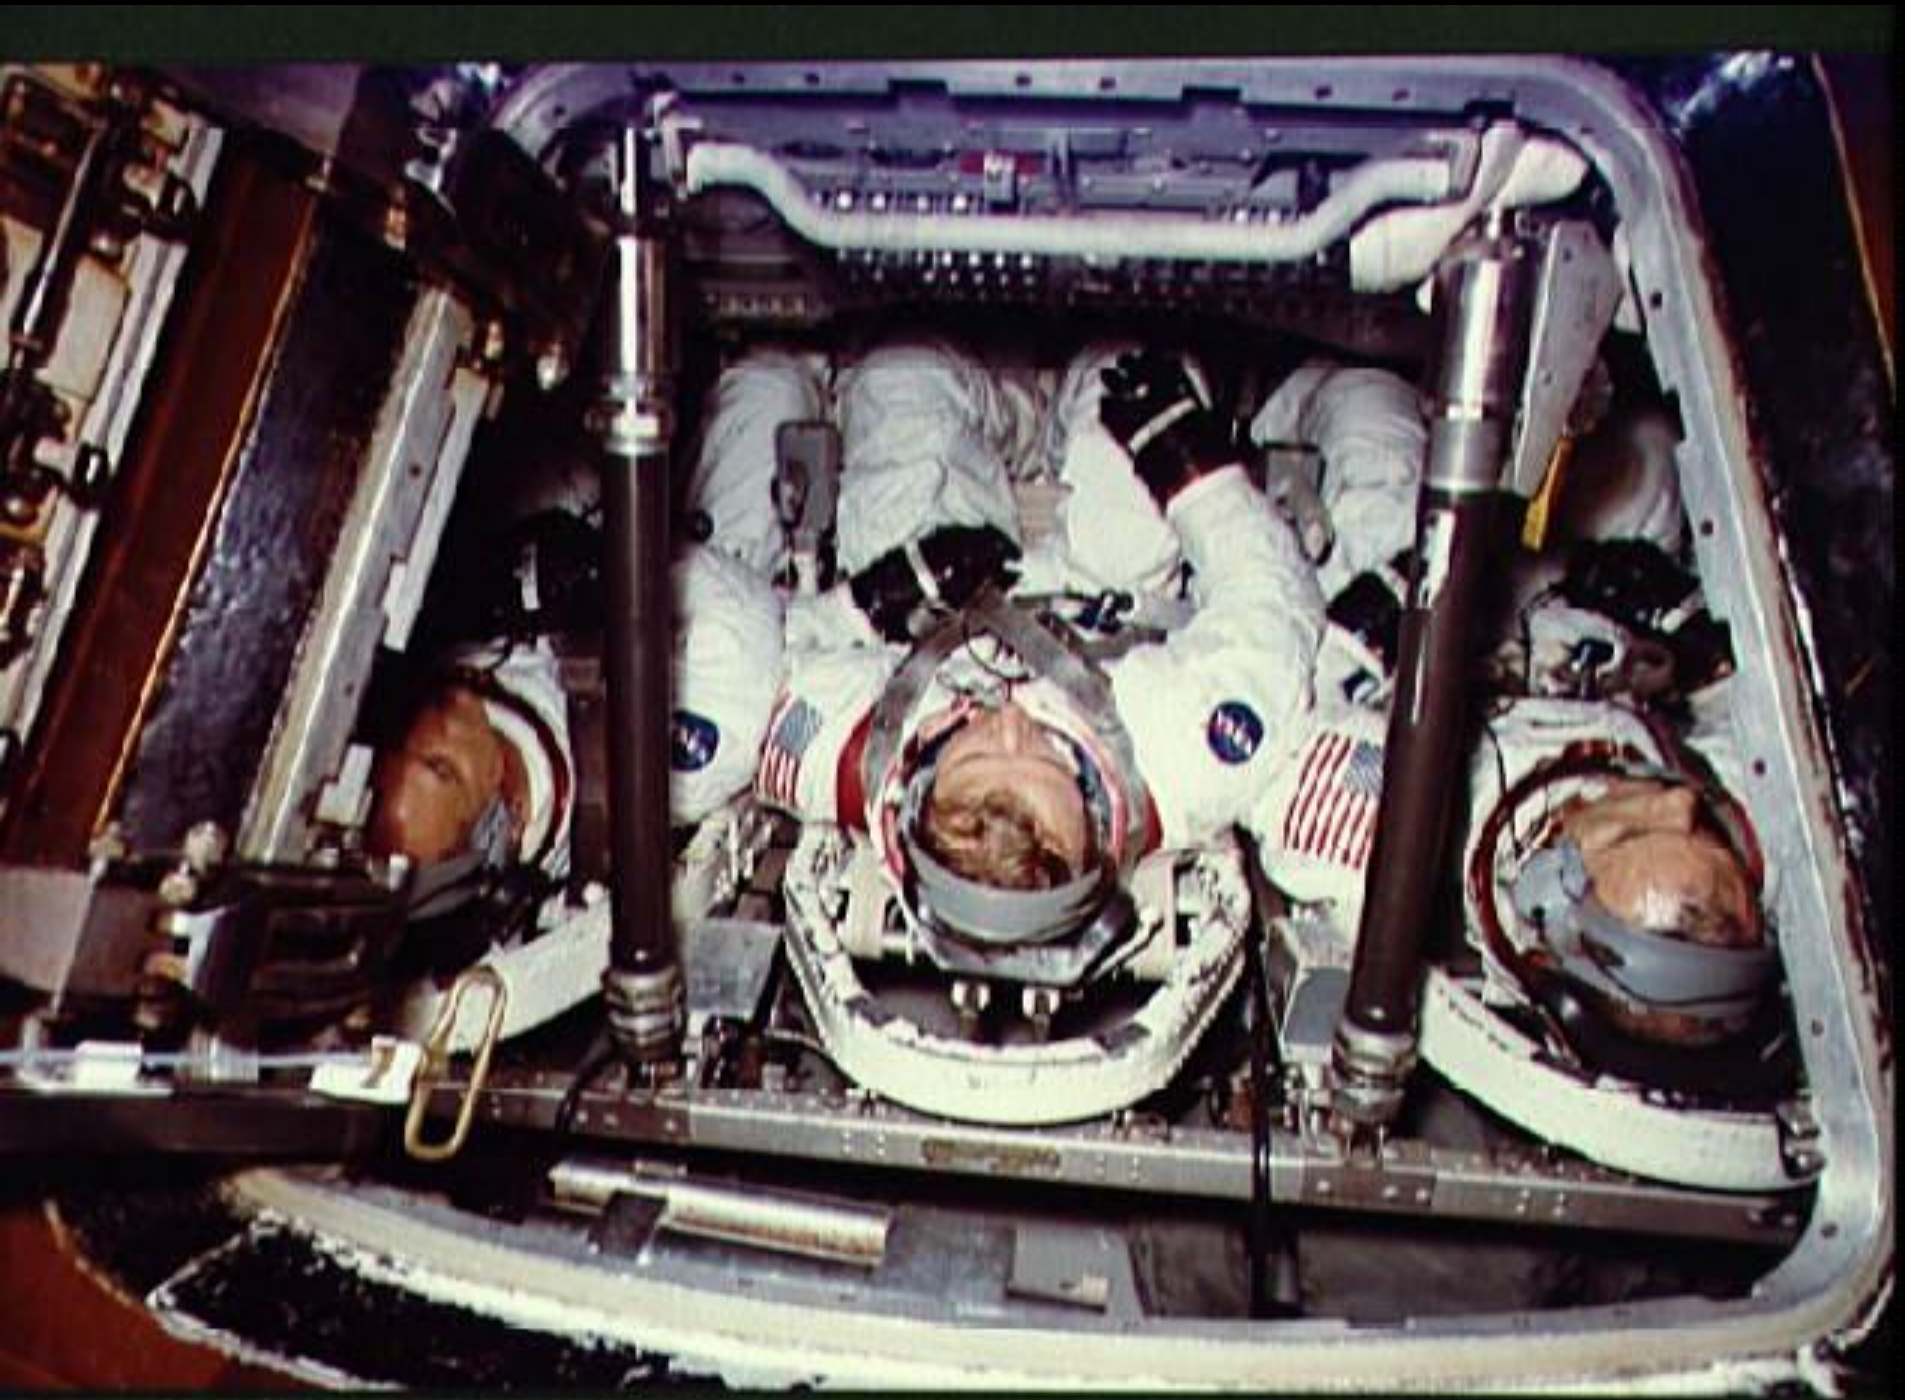

This type of undergarment was developed for female astronauts on early Shuttle flights to wear during launch or spacewalks. Male astronauts could wear a urine collection bag and bag assembly. None of these astronauts, male and female, chose to use ordinary, commercially available disposable undergarments when wearing pressure suits.
